Ultra-Lightweight Aeration Butterfly Valve

Connects directly to airline and weighs a fraction
of conventional aeration valves

Meet the latest addition to our expanding line of innovative products for the pneumatic tank trailer industry. Our new American made aeration butterfly valve offers the same flow characteristics as conventional ball valves and weighs only 1.5 lbs, that's 3lbs lighter than a conventional brass ball valve. It's also half the weight and less than half the cost of our closest aeration butterfly valve competitor!

Previously aeration valves were threaded on both ends requiring two additional king nipples to install in the aeration hose; this increased labor, weight and cost. The new valve comes standard with a king nipple to female connection or an optional king nipple to king nipple connection. And, for those wanting to save weight but use the female to female connection we offer that also.

Our new aluminum Ultra-Lightweight Aeration Valve is corrosion resistant, FDA compliant, competitively priced, easy to operate, and offers the same flow characteristics as a full port brass ball valve. And, like everything we manufacture, it's 100% American made.

American Made, Ultra-Light Weight, and Competitively Priced – a BTI trademark.
